**Attention:** Mr. Morgan Huang  

**Subject:** Slip Resistance of “Onyx Line” Porcelain Tile Samples  

**Reference**  
Determining the Co-Efficient of Friction of Porcelain Tile and Other Like Surfaces  
by the Horizontal Dynamometer Pull-Meter Method (ASTM C 1028-96)

---

Dear Morgan,

**1.0 Introduction**

On March 4, 2011, Construction Testing Laboratories Limited received samples of “Onyx Line” Porcelain tiles for the purpose of determining the static coefficient of friction.

**2.0 Procedure**

The Neolite friction material was prepared as instructed by the Standard by sanding with 400 grit silica paper. The Neolite surface was re-sanded after each separate step of the procedure. Calibration of the Neolite heel assembly was then performed using the ASTM C 1028 Standard Tile in dry and then wet condition in order to determine the dry and wet calibration factors. Testing was then accomplished on the sample by performing four pulls, with each pull being 90° from the previous pull. The samples were tested in “dry” condition followed by testing in “wet” condition. The samples were then cleaned with Hillyard’s Renovator solution and retested.

</table>

4.0 Closure

The static coefficient of friction of the “Onyx Line” Porcelain Tiles was found to be 0.62 in dry and 0.50 in wet test conditions.

The Occupational Safety and Health Administration recommends a static coefficient of 0.5 on walking surfaces, while the Access Board recommends 0.6 on walking surfaces with disability.

We trust this will meet your report requirements. If additional information is required, please contact the undersigned.

Respectfully submitted
